

SIGMA SERIES

SA1416

POWERED SUBWOOFER

The SA1416 powered subwoofer adds low frequency effects that are sent to the subwoofer in a separate channel from the DVD. Using CD, FM or video signals the receiver sends low frequency signals to the subwoofer. It has its own 150 watt amplifier built in. There are controls for volume, crossover frequency and phase. The sub also has a power switch with a separate standby switch to run in auto on mode. This enables you to turn to auto so the sub will turn off when you are not using the system or keep in on in low passages of movies or music.
